Assignment-12

Prepare By
~pintu mer

1. **Install FileZilla Server on your Windows machine, create a user account, and set up a shared folder for FTP access.**

Aim:

To install FileZilla Server on Windows, create a user account, and configure a shared folder for FTP access.

Procedure:

1. Downloaded and installed FileZilla Server on Windows.
2. Opened the FileZilla Server application.
3. Created a new FTP user account named student.
4. Set a password for the user account.
5. Created a folder named FTP-Shared.
6. Added the folder as a shared directory for the FTP user.
7. Assigned Read and Write permissions to the user.
8. Saved the configuration.

Result:

Successfully installed FileZilla Server, created an FTP user account, and configured a shared folder for file transfer using FTP.

2. **Use FileZilla Client to connect to your FTP server using the credentials you created, and upload any image file from your computer to the shared folder.**

Aim:

To connect to the FTP server using FileZilla Client and upload an image file to the shared folder.

Procedure:

1. Opened FileZilla Client.

2. Entered the FTP Server IP address.
3. Entered the username and password created in FileZilla Server.
4. Entered port number 21.
5. Clicked on Quickconnect.
6. Selected an image file from the local computer.
7. Dragged and dropped the image into the FTP shared folder.
8. Verified that the image was successfully uploaded.

Result:

Successfully connected to the FTP server using FileZilla Client and uploaded an image file to the shared folder.

3. Download the uploaded file from your FTP server to a different folder on your computer using FileZilla Client, and verify the file size matches the original.

Aim:

To download a file from the FTP server to a different folder using FileZilla Client and verify its file size.

Procedure:

1. Opened FileZilla Client and connected to the FTP server.
2. Entered the FTP username and password.
3. Opened the shared folder on the remote server.
4. Selected the uploaded image file.
5. Downloaded the file to a different folder on the local computer.
6. Checked the file properties of both original and downloaded files.
7. Compared their file sizes.

Result:

Successfully downloaded the image file from the FTP server and verified that its size matched the original file.

4. Research and list 3 real-world scenarios where SNMP is used in network management for apps or services you use (such as ISPs, campus WiFi, or large websites).Hint:Think about how network admins monitor device health, bandwidth, or uptime.

Aim:

To identify three real-world scenarios where SNMP is used in network management.

1. ISP (Internet Service Provider)

SNMP is used to monitor routers, switches, bandwidth usage, and network uptime. It helps detect network problems.

2. Campus WiFi

Network administrators use SNMP to monitor WiFi access points, connected devices, bandwidth usage, and device health.

3. Large Websites / Data Centers

SNMP is used to monitor servers, switches, routers, CPU usage, temperature, and network performance to maintain uptime.

Result:

SNMP helps network administrators monitor device health, bandwidth, and uptime, and quickly identify network problems.

5. Create a table comparing FTP and HTTP across at least 5 points: port number, security, data transfer method, use cases, and authentication.

Difference Between FTP and HTTP

Points	FTP	HTTP
Full Form	File Transfer Protocol	Hypertext Transfer Protocol
Port Number	21 (Control), 20 (Data in Active Mode)	80
Security	Not encrypted by default	Not encrypted by default
Data Transfer	Uploads and downloads files	Transfers web pages and web content
Use Cases	File sharing and file transfer	Accessing websites and web applications
Authentication	Supports username and password	Usually does not require login; websites may use authentication
Secure Version	FTPS / SFTP	HTTPS (Port 443)

Result:

FTP is mainly used for file transfer, while HTTP is mainly used for accessing websites and web content.
